Campus Recruitment challenge

Welcome to the Hackathon! Your challenge is to build your college's very own feed app — a place where students share updates, announcements, and discussions in a clean, structured feed.

What You're Building

A campus feed that supports three post types:

1. **Event Posts** – for workshops, college fest, or club activities (students can mark *Going/Interested/Not Going*). Must have `Event` entities:
 - a. Description/ blurb about the event
 - b. Location of event
 - c. Date of event
2. **Lost & Found Posts** – to report lost items or announce when something is found. Must have `LostFound` entities:
 - a. Item lost or item found
 - b. Last known location or found location
 - c. Image of item lost or found (optional)
3. **Official Announcements** – for notices, timetables, and campus-wide updates. Must have `Announcement` entities:
 - a. Department which issued the announcement
 - b. Circular image or PDF attachment

The feed should contain **only these post types** to keep it meaningful and uncluttered.

How Posts Get Created (The Core Experience)

Instead of separate forms, you will design a **single input textbox**:

- Students type naturally, e.g.:

"Lost my black wallet near the library yesterday evening"

"Workshop on Docker tomorrow at 5pm in CSE Lab"

- Optionally, attach an image or PDF with the prompt
- The system should **figure out the intent** (Lost & Found, Event, or Announcement) and generate a **standard post card preview**.
- The preview is **editable** — the student can tweak details before posting (title, description, location, date, etc.).

👉 This single-prompt → smart classification → editable preview flow is the **heart of the problem statement**.

Wireframes representing this flow:

The wireframe shows a rounded rectangular container. Inside, at the top, is the text "what would you like to share?". Below this text is a large, empty rounded rectangular input field. In the bottom right corner of this input field is a small square button containing an upward-pointing arrow. Below the input field, centered within the container, is the text "1. Unified input prompt to create new posts".

Does everything look good?

Event post

At location: ↘

RSVP:

Nah! Restart flow

Looks good! Post it

2. Editable post preview

## ✨ AI Features (Your Differentiators)

### Smart Post Creation (Single Textbox + Editable Preview)

1. The textbox interprets intent and builds the correct post type.
2. Students see a neat card preview they can edit before publishing.

## ✅ What Matters Most

- The single textbox → smart card preview → edit → post workflow.
- A clean, consistent feed with only Events, Lost & Found, and Announcements.
- AI features feel helpful and natural.
- Polish — thoughtful touches like empty states, badges, and smooth UI transitions.

## Guidelines for Participants

Before you dive in, please read these guidelines carefully.

## 1. Coding expectations

- We will evaluate **Git commits** to understand how you planned your work and how you implemented.
- Keep commits **granular, well-labeled, and tied to clear tasks/features/responsibilities**.

## 2. Platform Choice

- You are free to build a **web app or a mobile app**.
- The judging rubric remains the same.
- Mobile apps must still respect **time feasibility** — prioritize working prototypes over ambitious breadth.

## 3. No-Login Policy

- This is a **no-login project**.
- Instead of building auth flows (signup/login/reset), simulate identity as follows:
  - **Mobile apps**: assign user sessions with a **Device ID**.
  - **Web apps**: assign user sessions with a **Cookie**.
- **✗** Do not waste time building authentication. Focus on the **feed + post types + AI features**.

## 4. AI Usage – Expectation & Encouragement

- We expect teams to **actively use AI models** during the hackathon in two ways:
  - a. **For development**: leverage models like Github Copilot, Gemini Pro, or other available AI models for **code generation and assistance**.
  - b. **For features**: integrate AI APIs into your project to power **the AI-driven aspects of the feed** (e.g., prompt understanding, post creation etc.).
    - i. Your team will be provided with a shared OpenAI API key for usage during hackathon.
- You may choose your tools, but you must demonstrate **understanding and ownership** of the code and logic AI helps you generate.

 We are monitoring your OpenAI API key usage and any abuse will result in elimination.

---

## Evaluation Criteria

Your submission will be judged across **four categories**. Judges will assign scores independently, and totals will be normalized.

## 1. Completion & Functionality – 30%

- ☒ Required post types (Event, Lost & Found, Announcement) all supported
- ☒ Single textbox → correct classification → editable preview works reliably
- ☒ Core feed interactions (posting, editing) work without breaking

### Scoring Guide:

- 0–5: Major features missing/broken
  - 6–7: Most features work but rough edges remain
  - 8–9: All features present, minor polish missing
  - 10: Fully working, stable, no major bugs
- 

## 2. Design & User Experience – 20%

- ☒ Posts and comments appear clean, readable, and consistent
- ☒ Editable preview feels smooth and intuitive
- ☒ Feed is uncluttered and easy to navigate

### Scoring Guide:

- 0–5: Poor UI, confusing flow
  - 6–7: Acceptable UI, inconsistent polish
  - 8–9: Intuitive and cohesive UX
  - 10: Professional-level polish, delight in details
- 

## 3. Code Practices – 50%

- ☒ Clear, timely Git commits
- ☒ Commit messages are logical and meaningful
- ☒ Code structure shows readability and maintainability

### Scoring Guide:

- 0–5: Poor commits, unclear thought process, messy code
  - 6–7: Basic commits exist but made in unstructured way
  - 8–9: Good practices, visible thought process, minor gaps
  - 10: Excellent commit hygiene and organisation of work
- 

All the best! We can't wait to see what you build :)
